Ryder – RydeSmart Application   02/2015 to 06/2016

RydeSmart is the proprietary logistics system used by Ryder Integrated Logistics. It uses sensors installed on their fleet vehicles to measure Key Performance Indicators (KPI), such as speed limit, elapsed time, designated route, idle time, traffic violations, late delivery time plus many other measurements.

DRIVERS CATEGORY

The driver dashboard helps you to find out, at a glance, how things are going for a particular driver. You can see whether drivers are performing in line with expectations or if there has been a spike in activities which might lead to increased fuel usage or risk out on the roads. The dashboard also shows other sensor information, such as speeding incidents, excessive idling, harsh acceleration, hard braking, accidents and traffic tickets.
